SYNTHETIC EXAMPLE - AI SALES COPILOT EXPERIMENT

Study protocol (illustrative, not independently certified)

Exactly 150 of the 300 salespeople were selected uniformly without replacement.

The remaining 150 salespeople received no AI access during the eight-week pilot.

Collaboration links were recorded before treatment assignment.

The network file is an edge list with employee IDs and relationship strengths.

We logged each participant treatment assignment and post-pilot sales outcome.

These are one-pilot finite records, not a certified population observable law.
